

Khamsat Predictor

Problem Statement

In the freelance world, two major challenges are **trust** and **price anxiety**. Sellers, especially new ones, fear setting prices too high and losing clients or too low and undervaluing their effort. Meanwhile, clients worry about overpaying for services that don't match their value. Addressing these issues requires solutions that foster trust, fairness, and transparency for both parties. The target site is **Khamsat**, the largest platform for Arab freelancers.

Proposed Solution

To determine pricing, I'll use artificial intelligence, specifically classical machine learning. By collecting and organizing data from **Khamsat** through web scraping, I'll build a model that predicts accurate prices based on offer features. A friendly UI will allow users to input these features and instantly receive a predicted price, creating a seamless, intelligent pricing solution.

Expected Impact

The project will deliver an AI-based pricing model, offering accurate price predictions based on offer features. It will enhance user confidence by ensuring fair, data-driven pricing. Ultimately, it will foster trust and efficiency in the freelance marketplace, benefiting both sellers and customers with transparent pricing.
